

# PROG 6212

Part 2: ST10438345

# Lecturer Feedback

Behavioural methods dominate instead of focusing on database structure, HR and Invoice entities are missing, and the inheritance between User and other roles isn't properly represented. The diagram needs clearer UML multiplicities, role separation, and inclusion of all required entities to meet full accuracy.
Large lack of detail, dependencies, progressions, and duration of each task. Not in gantt chart format.
Unfinished. Where are the GUI designs for all features and requirements?

I implemented my full GUI design as initially planned but had failed to show that in my Part 1. Each page has it's necessary functionality without any clashes. Each page is designed as planned and the logic flow allows my Web App to function correctly with it's buttons. My lecturer page needs no login authentication, but for Co-ordinators and Managers login details are required to avoid anyone from logging into who isn't authorized, and if incorrect details are typed in then an error message pops up. On my home page anyone can click on the buttons to view claims and can see each status of each claim. And lastly each page has it's own design layout.
